Description			
Hi Luke,			
could you please add an option, to use the client certificate authentication like it is possible in Website Monitoring.			
If a web page is more complex (especially extensive use of javascript) the usage of the virtual browser produces better results (in case of angular.io a result at all). But my server use the SSL two-way authentication.			
Kindly regards			
Kai

I try to implement this and send a pull request, if it works.
