Target version:	2.9			

Description

Define warning_threshold and error_threshold values in the modular input such that the UI can have customizable settings for the threshholding.

```
1. Keep the global threshold (from the "define a failure" dialog), but add a warning threshold as
well. (so it isn't hard-coded as 50% of the error threshold)>
2. Modify web_ping.py to 'pass through' the warning_threshold and error_threshold, if defined, int
o each event.
3. Modify the UI to use this logic:
    a. If the event has the thresholds (meaning they were defined in the input), use them.
    b. Otherwise, use the global ones from the dialog/macros
```
